CC5 Course Project Information System Design and Implementat

Phase 2: Database Design Concepts and SQL Introduction

Deliverable 4: Entity-Relationship Diagram (ERD) Specification

This document presents the complete architectural specification and design for the system Entity-Relationship Diagram (ERD). The design uses standard Crow's Foot notation to depict system entities, primary keys, foreign keys, non-key attributes, data types, cardinality, and optionality constraints.

The domain modeled is a Retail Order Management System. The diagram structure establishes referential integrity and supports core operational workflows including user management, inventory cataloging, order processing, and payment reconciliation.
